Introduction to Eclipse

If you are new to Eclipse, please take the time to go through this introduction, and familiarize yourself with the basics of the Eclipse framework.

If you have worked with Eclipse before, you may skip this section.

Running Eclipse is as easy as launching the Eclipse executable - "eclipse" on Linux / Unix platforms, "eclipse.exe" on Windows - in the top-level Eclipse directory.

In case you are new to Eclipse and run into problems, try the Eclipse FAQ.

When the Eclipse Workbench is launched, the first thing you see is a dialog that allows you to select where the workspace should be located. The workspace is the directory where your work will be stored. When you start Eclipse for the very first time after installation, Eclipse will propose a workspace named "workspace" located in your "home" directory (depending on the operating system you are running Eclipse on). Either just click OK to pick the default location, or specify a path + filename of your choice, then click OK. (You can also check the checkbox to prevent this question from being asked again.)

Workspace Launcher	
Select a workspace	
Eclipse SDK stores your projects in a folder called a workspace. Choose a workspace folder to use for this session.	
Workspace: D:\ASGeclipse\myworkbench Browse	
Lise this as the default and do not ask again	
OK Cance	<u>. </u>

After the workspace location is chosen, the Eclipse Welcome Screen will be shown.

You may want to start by going through some of the introductory tutorials offered by Eclipse, or just commence to the Workbench by clicking the bent arrow in the top right corner.

A single Workbench window is displayed. A Workbench window offers one or more perspectives. A perspective contains editors and views, such as the Package Explorer. Multiple Workbench windows can be opened simultaneously. Initially, in the first Workbench window that is opened, the Java perspective is displayed.

(You can get the Welcome view back at any time by selecting **Help** > **Welcome**.)

A shortcut bar appears in the top right corner of the window. This allows the user to open new perspectives and switch between ones already open. The name of the active perspective is shown in the title of the window and its item in the shortcut bar is highlighted.

The title bar of the Workbench window indicates which perspective is active. In this example, the Java perspective is in use. The Package Explorer, Problems, and Outline views are open along with an editor. The "editor" view is the one in the center of the screen and is currently "empty" because no resources have been opened for editing so far.

Elements of the Workbench

A Workbench consists of:

- perspectives
- views
- editors

Perspective

a group of views and editors in the Workbench window.

One or more perspectives can exist in a single Workbench window, each perspective contains one or more views and editors. Within a window, each perspective may have a different set of views but all perspectives share the same set of editors.

View

a visual component within the Workbench.

Typically used to navigate a hierarchy of information (e.g. the resources in the Workbench), open editors, or display properties for the active editor. Modifications made in a view are saved immediately. Only one instance of a particular type of view may exist within a Workbench window.

Editor

also a visual Workbench-component.

Used to edit or browse resources. Modifications made in an editor are only saved when explicitly requested. Multiple instances of an editor type may exist within a Workbench window concurrently.

Parts

as views and editors have a number of features in common, the term *part* is used to mean either a view or an editor.

Parts can be active or inactive, but only one can be active at any one time. The active part is indicated by a highlighted title bar and is the target for common operations like cut & paste.

Creating Resources

New resources (e.g. projects, folders, files) can be created using several different approaches:

- 1. File menu
- 2. Navigation view context menu
- 3. New Wizard button

First of all, a *project* must be created using the **File** menu.

ile Edit Source Re	factor Navigate Se	arch Project Run Wir	ndow Help	
New	Alt+Shift+N	Project

The "New Project Wizard" appears, select Java Project and click Next.

🕞 New Project	
Select a wizard Create a Java project	
Wizards: Java Project Java Project from Existing Ant Buildfile Plug-in Project CVS Eclipse Modeling Framework Dava Plug-in Development Simple	
	(<u>?</u>)
< Back Next > Einish	Cancel

Enter a Project name**Project name**, make sure to check the **Create separate source and output folders** selection, click **Finish** to create the project.

൙ New Java Project	
Create a Java project Create a Java project in the workspace or in an external location.	
Project name: Demo Contents Create new project in workspace Create project from existing source Directory: D:\A5Geclipse\myworkbench\Demo	Browsen
JDK Compliance Use default compiler compliance (Currently 1.4) Use a project specific compliance: 1.4 -	Configure default
Project layout C Use project folder as root for sources and class files C Create separate source and output folders	Configure default
< <u>Back</u> <u>N</u> ext > Ei	nish Cancel

The **Package Explorer** now shows the project folder you just created, the "+" icon to the left of the project name indicates the folder is not empty, so click the "+" sign to see what's there.

Note:

The symbol used to indicate a resource has contents and can be "unfold" is platform specific, this will be a "+" sign on Windows, an arrow on Linux.

The New (Java) Project Wizard did the following:

- create an empty srcfolder
- add the Java Runtime Environment (JRE) to the project's class-/buildpath
